

Audit Checklist

Ethereum Smart Contracts – Version 1.1

Send us the scope for the audit:	
	Send us relevant documentation such as whitepapers, websites or online documentation Send us the repositories and commit hash that should be used for the quote Specify the relevant directories/files in the repositories for the audit Send us an outline of how the scope/code will change before the audit begins, including a detailed description of any still unimplemented parts
In addition, before the audit start:	
	Resolve any compiler warnings
	Run a linter, for example solhint
	Ensure all tests of your projects pass
	Ensure you have sufficient test coverage, e. g. through <u>soldity-coverage</u> : npx hardhat coverage
	Remove any files that are not specific to your project, e. g. Markdown files from a template you used
	Remove any commented/unused code
	Resolve any pending TODOs
	Send us the repositories and commit hash that should be used for the audit (code freeze)
	Specify the relevant directories/files in the repositories for the audit
	Make sure that your project builds correctly on clean system by pulling all the necessary dependencies

☐ Document your build and test system (e.g. add an example .env file for local deploys)
